FOREWORD

Praise be to Allah, the Most Gracious and the Most Merciful. With his blessings and guidance, the research team has completed the research report entitled: “Facilitating Students’ Multimodal Competence Development in Technology-Supported Speaking Class through Multiliteracy Pedagogy.”

This book is the result of a research project conducted throughout 2023 at the English Language Education Department of the State Islamic Institute of Curup (IAIN Curup). The study explores the implementation of multiliteracies pedagogy in speaking classes supported by technology, aiming to foster students’ multimodal competence—an essential skill in this era of rapid technological and educational transformation.

We extend our sincere gratitude to the leadership of IAIN Curup, colleagues, and academic staff who provided continuous support and encouragement during the research process. Special thanks go to the fifth-semester students of the Speaking for Academic Setting course who participated as research subjects, and whose cooperation was instrumental to the success of this study.

We hope this book will serve as a valuable contribution to the development of English language

teaching, particularly in the integration of multiliteracies and digital competencies within higher education. May it benefit educators, researchers, and curriculum developers in designing more relevant and transformative pedagogical models.

Constructive feedback and suggestions for future improvement are warmly welcomed.

Curup, May 16, 2025

CHAPTER 1: INTRODUCTION

A. Background

Traditionally, one of the primary goals of English language instruction has been to equip students to communicate effectively in English. Consequently, the presence of qualified English teachers with excellent pedagogical and communication abilities will significantly help achieve this goal. With these two qualities, qualified English teachers may effortlessly manage the teaching-learning process and act as English language role models for students. In fact, the Republic of Indonesia Law No. 14 of 2005 specifies these two competences (Indonesia Government, 2005). As a result, an English teacher is required by law to have a strong command of the English language as well as knowledge and skills in English language instruction.

However, some studies have revealed that English teachers in some parts of Indonesia do not have adequate English proficiency (Asriyanti et al., 2013; Astriyanti et al., 2015; Budiharso, 2019; Gunawan Tambunsaribu & Yusniaty Galingging, 2021; Kurniawan, 2019; Sukyadi et al., 2018; Sulistiyo, 2016; Widiyanto, 2012). English teachers lacked speaking practice, resulting in a lack of command of the oral usage of English. Worse, their capacity to teach English is equally lacking (Budiharso, 2019; Sukyadi et al., 2018). Their burden is going to be heavier as the development of ICT requires them to communicate not only using linguistic features but also combining various modes of

meaning making, such as visual, gestural, auditory, etc.

One possible solution to the aforementioned issues is to prepare students in the English education department as prospective teachers to be fluent in English from their first year of study. They must be prepared to communicate effectively in English, not only by employing linguistic features but also by combining linguistic features with other modalities of meaning production. As a result, students will be prepared to tackle disruptive changes in society as a result of globalization and the rapid expansion of ICT.

Numerous scholars have argued that in the present conditions, a shift in literacy viewpoint is essential. Literacy and literacy practices must be expanded (Cope & Kalantzis, 2009; Durrant & Green, 2000; Gee, 2000; Kress, 2003; Mills, 2010; New London Group, 1996). New conception of literacy must include skills and knowledge of comprehending, generating, and communicating meaning in multimodal texts applicable to varied sociocultural situations (Cope & Kalantzis, 2015b; Kellner, 2001; Kress, 2003; Mills, 2010a; New London Group, 2000; Zammit, 2010; Zammit & Downes, 2002). Additionally, this situation pushes teachers in general and English language teachers in particular to broaden the scope of their instruction and to look for suitable methods.

Conversely, teaching and learning foreign and second languages must encompass more than only linguistic knowledge and functional communication skills (Suherdi, 2012b, 2012a; Taylor, 2009). In addition to being able to use language effectively in a variety of

social contexts, TESOL (Teaching English to Speakers of Other Languages) students need to be able to comprehend and produce texts in multimodal ways that are pertinent to their culture and context (Bianco, 2000; Coccetta, 2018; Royce, 2002, 2007; Stenglin & Iedema, 2001). On account of that, it is reasonable to argue that with the proliferation of various multimodal texts, language instruction and learning should focus on improving students' multimodal competence (hereafter MMC).

In an MMC-oriented classroom, students are encouraged to acquire the ability to interpret and construct appropriate multimodal meanings. (Royce, 2002, 374). Students are trained to tailor the integration of two or more meaning-making modes in a single text. MMC emphasizes how critical pupils' analytical abilities are. With the use of these abilities, students critically evaluate and assess the text's elements and techniques to logically communicate culturally and contextually appropriate meaning. These abilities assist students in comprehending how different modes exhibit their meaning in tandem and the co-occurring nature of the interaction between them. Students use their analytical skills to comprehend how the mixed meanings produced by several modes frequently result in a visual and verbal partnership, providing a richer and fuller conveyance of meaning than would be feasible with just one modality. Lastly, the abilities allow students to appropriately and meaningfully use, understand, and develop semiotic resources (Coccetta, 2018; Ruiz-Madrid & Valeiras-Jurado, 2020).

Multiliteracies pedagogy offers fascinating answers to these problems (New London Group, 1996). By considering linguistic and cultural variety, it offers a more comprehensive viewpoint on reading teaching. Multiliteracies teaching emphasizes critical engagement and provides students with access to the evolving language of labor, power, and society so they may influence their social destiny and achieve via satisfying work (Cope & Kalantzis, 2009; New London Group, 1996). The multiliteracies approach in EFL emphasizes the broader definition of literacy, which includes the ability to utilize and produce texts that are relevant to social objectives and meaningful and coherent (Kern, 2000, p.6).

There has also been much research on the effectiveness of multiliteracies teaching and knowledge processes in EFL environments generally and ESL situations specifically (Burke & Hardware, 2015). The use of multiliteracies pedagogy has been empirically demonstrated in several studies on a range of topics, such as student experiences, learning outcomes, and perceptions (Byrnes et al., 2010; Maxim, 2002; Paesani, 2016; Paesani et al., 2015; Redmann & Sederberg, 2017); teacher perceptions and understandings of the pedagogy (Paesani, 2013); the use of knowledge process in EFL and ESL (e.g., Bhooth, Azman, & Ismail, 2014; Michelson & Beatrice Dupuy, 2014); and According to several studies, students' positive writing and literate identities may be enhanced by using multiliteracies teaching (Hughes & Morrison, 2014; Black, 2009; Thorne et al., 2009).

Given the aforementioned facts, conducting the study at the English Department of the State Islamic Institute Curup (IAIN Curup) is expected to provide a substantial contribution to the institution. The department will benefit theoretically and practically by preparing students to be informed and skilled English teachers with a good foundation of Islamic knowledge and who are also technologically savvy.

Furthermore, higher education has always been seen as a critical public realm in which moral and pedagogical features have a significant impact on civic life. Incorporating multiliteracies teaching into postsecondary education is predicted to result in a great potential for ongoing societal transformation.

It is especially noteworthy that the old literacy paradigm continues to dominate teaching and learning activities at IAIN Curup in general, and particularly in the English language department. According to this conventional viewpoint, the goal of English language teaching and learning is primarily to increase students' communicative skills. A first study on the understanding of multiliteracies by lecturers. Additionally, pedagogy discovered that the study's lecturers were cognizant of how new communication technologies impact literacy practices, forms, knowledge, and literacy instruction. However, their lack of comprehension of multiliteracies instruction, as well as the assistance they get, inhibits them from implementing it (Prihantoro, 2020).

Taking into account the foregoing facts and the need to give an alternative format of multiliteracies

pedagogy in ELT, the current study aimed to analyze the implementation of multiliteracies pedagogy in technology-supported speaking classes to promote students' multimodal competence.

B. Research Questions

The purpose of this study is to depict the implementation of multiliteracies pedagogy in a technology-supported speaking class to build students' multimodal competence. Thus, the guiding questions of the study were:

- A. Through the implementation of multiliteracies pedagogy in technology-supported speaking classes, in what ways can the incorporation of learning technology and multiliteracies pedagogy foster students' multimodal competence?
- B. How do students respond to the inclusion of multiliteracies pedagogy in technology-supported speaking classes?

C. Purpose of the Study

In order to improve students' multimodal competency, this study focused on using multiliteracies pedagogy in a speaking class that uses technology. This research developed an alternate format of multiliteracies pedagogy by using ICT in the instruction of speaking. It attempted to explain how this alternate format might help students improve their English language learning and multimodal competence.

D. Significance of the Study

By striving to develop a different multiliteracies teaching format to increase students' multimodal competency, this research made a significant addition to ELT. The information, design, and useful solutions provided by this study's findings helped English teachers and ELT practitioners deal with the integration of ICT and multiliteracies teaching. The results of the study should help Islamic higher education institutions make decisions on the curriculum, textbooks, and online modules for their English language programs.

CHAPTER 2: LITERATURE REVIEW

A. The Pedagogy of Multiliteracies

The manner that literacy should be taught has changed as a result of the new concept of literacy as many literacies or multiliteracies. Students who get literacy education should be better equipped to navigate a world that is becoming more globalized and culturally and linguistically diverse. The need to broaden the scope of literacy instruction in this context led the New London Group to advocate for "multiliteracies pedagogy". The multiplicity of cultures and texts found in the increasingly multicultural and multilingual globalized world should be considered in literacy instruction, according to multiliteracies pedagogy. The increasing variety of text kinds related to ICT should also be considered. Knowledge and proficiency in multimodal meaning-making must be taken into account (New London Group, 2000; Cope & Kalantzis, 2015a).

Multiliteracies Pedagogy allows multiple forms of meaning-making as well as other relevant aspects that influence how the modes are employed to deliver the message (Cope & Kalantzis, 2015b, 2015a; New London Group, 2000). Meaning-making is characterized in multiliteracies pedagogy as an intentional process of constructing meanings in which individuals pick and set up numerous semiotic modalities for specific intrapersonal and interpersonal purposes relevant to the sociocultural setting. Instead of viewing these processes of meaning-making as

rigidly prescriptive, people use and alter shared socio-cultural resources through their subjectivities (New London Group, 1996).

Two main issues in multiliteracies instruction are as follows: first, multimodal texts and multimodal semiotic resources participate in meaning construction in a complicated way. Second, meaning is always being created and altered (Cope & Kalantzis, 2009). The first issue is multimodality, which pertains to the variety of text forms and the shifting social and semiotic environment: "meanings are formed utilizing a variety of representational and communicational resources" (p. 246), according to Jewitt (2008).

The idea of design serves as the foundation for the second problem, which is the act of creating meaning. A key component of the design idea is the active participation of the instructor and the student as the designer in the process of creating meaning via the reconstruction and adaptation of any semiotic materials (New London Group, 1996). According to Cope and Kalantzis (2009), the multiliteracies framework uses the term "design" to refer to both the designer and the process of creating. Design may operate as both an active maker of meaning and an inheritor of meaning standards, claim Kumagai et al. (2016). Both the process of designing and the form of meaning can be referred to as design (Cope & Kalantzis, 2009).

The New London Group divided design into three areas while establishing the multiliteracies framework: (1) available designs, (2) designing, and (3) revised (New London Group, 2000). According to the

New London Group (1996), "available design" refers to the resources that may be employed in addition to whatever other resources are available to produce meaning. The second element is designing, which includes "representation and recontextualization" as part of the process of creating emergent meaning (New London Group, 2000). In order to create meaning, several meaning sources have to be converted, not just a copy of Available Designs. The outcome of the design process is the final, redesigned component. It is the reproduction and modification of new meaning via the processes of creating and re-designing. In practice, learners may exhibit the design of meaning by gleaning information from multimodal resources using their understanding and analytical abilities, then applying that knowledge and understanding to varied social settings (Cope & Kalantzis, 2009). The implications of this paradigm shift in meaning-making are profound since, in contrast to more conventional forms of communication, multiliteracies need substantial agency engagement in the meaning-making process. The goal of the Multiliteracies framework is to make education more efficient, relevant, innovative, creative, and maybe even liberating. Figure 1 depicts the process of creating meaning through design.

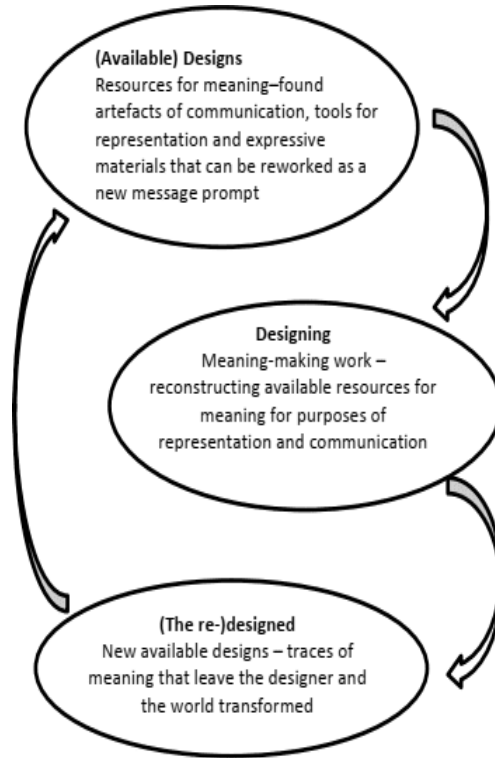

Figure 1. Process of Meaning design

The New London Group defines six design attributes—linguistic, auditory, gestural, spatial, visual, and multimodal—that are essential to the process of meaning-making (Cope & Mary Kalantzis, 2000). While the auditory process creates meaning via sound (such as music, sound effects, and singing), the linguistic process creates meaning through language (such as spoken and written words). Images convey visual meaning (e.g., paintings, drawings, collages, and photographs);

gesture conveys gestural meaning (e.g., hand gestures, facial expressions, movement, and dance); and space conveys spatial meaning (e.g., 3-D creations, sculptures, and buildings). The student or designer will combine these design elements or expressive styles. The multimodal element is unique in that it shows how all modes are interconnected (New London Group, 1996).

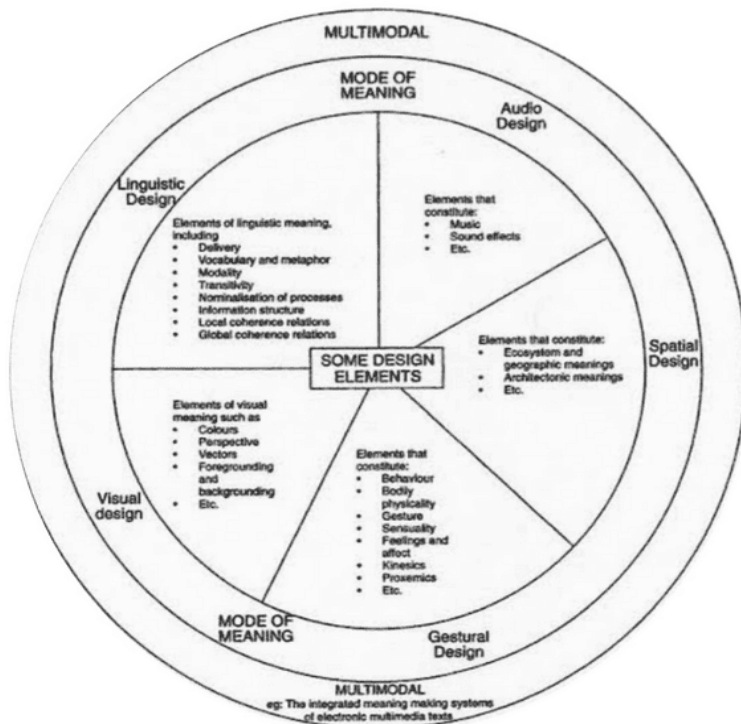

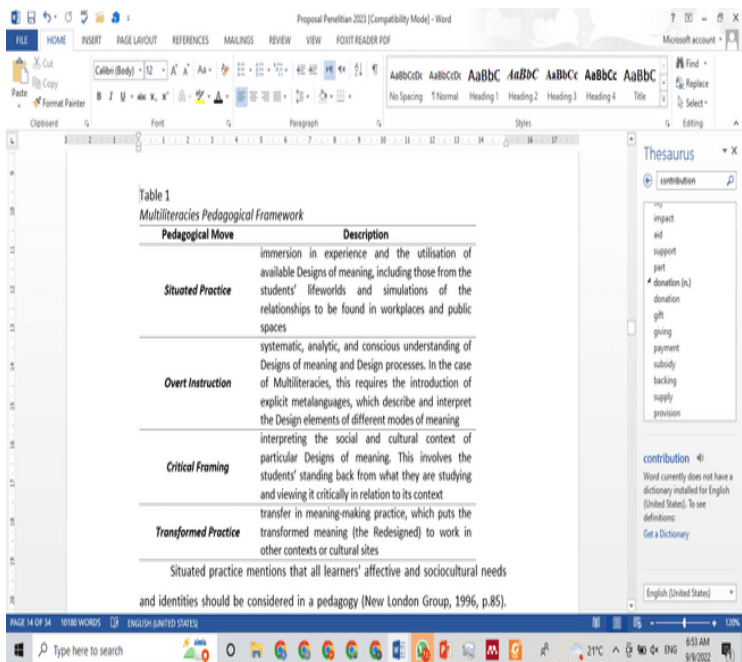

Figure 2. Elements of Design

Digital technology has also had an influence on how

design parts are assembled. Because it encourages the use of several modes, it is commonly related to the multimodal design characteristic (Eteokleous et al., 2015; Lynch, 2015; Rabadán, 2015; Tan & McWilliam, 2009). Kress defines six types of meaning-making in his theory of multimodality (Kress, 2003; Kress & Luwen, 2001).

The educational framework for multiliteracies emphasizes key themes for enabling students to be more effective meaning makers. This shift in the educational framework must include how developing literacies and technologies enable learners' interests, needs, personalities, identity distinctions, cultural and linguistic diversity, and knowledge reservoirs to be met through learning, teaching, and regular classroom activities (Moje & Luke, 2009). Multiliteracies pedagogy provides students with multiple opportunities to critically examine information, multimodally analyze different information sources and materials, and become active meaning-makers and effective communicators (Cooper et al., 2013). According to the New London Group, multiliteracies pedagogy is a distinct type of pedagogy in which students use language, other meaning-making processes, and dynamic representational resources that are constantly created by their users to achieve a variety of cultural goals.

Four pedagogical components, or the how of multiliteracies, account for the interconnections of the design features or modes: (1) situated practice, (2) overt instruction, (3) critical framing, and (4) transformed practice (New London Group, 1996). Table 1 describes the educational methodologies for multiliteracies.

The pedagogy of situated practice should include the emotive and sociocultural needs and identities of all learners (New London Group, 1996, p.85). Students' participation in class activities should be based on their histories and experiences. By doing so, students will feel more at ease taking chances when

their actual worlds— their homes and cultures—are introduced into the classroom (New London Group, 1996). Depending on their unique teaching environments and the needs of their students, educators must develop a variety of teaching and learning strategies in this pedagogical change. They must also assist students in connecting their personal and academic experiences.

The second element is overt instruction, which is when teachers help students learn by giving them clear and concise instructions (New London Group, 1996). Through explicit instruction, teachers help students reach the learning objective. Rowsell et al. (2008) define overt teaching as all of the actions utilized in the classroom to develop students' abilities and knowledge, such as lessons, openers, wrap-up activities, modifications, and assessment strands. Overt instruction, on the other hand, is a deliberately planned exercise aimed at supporting pupils' learning (Mills, 2009). To scaffold students' knowledge and abilities, teachers must employ their professional knowledge and experience during overt instruction.

The third element is critical framing. The goal of this component is to aid students in developing critical thinking abilities by supporting them in understanding the contexts of their learning and relating what they learn to bigger contexts. Students develop their own body of knowledge and practices via critical examination, interpretation, deconstruction, and reconstruction. Students learn to dissect a text's layers and evaluate each element according to its form,

multimodality, language, discourse, and function through the use of critical framing activities. Students develop their metacognitive abilities by using critical framing to challenge both their own presumptions and those included into the text (Rowse, 2006).

Students reflect on their prior knowledge and change it into a new design that is informed by their own goals and beliefs as part of the last educational component, transformed practice (New London Group, 1996). Transformed practice is essentially how multiliteracies pedagogy expresses its goal. One instructional strategy that encourages students to apply what they have learned in novel ways is transformed practice. Outside of the classroom, students will use the information and abilities they have acquired via situational practice, explicit teaching, and critical framing (Mills, 2006; New London Group, 1996). Transformed practice promotes creative growth by allowing students to relate their learning to their cultural experiences and vice versa (Mills, 2006; 2007). According to the New London Group (1996), teachers must provide a variety of opportunities for students to practice knowledge transformation so that they may apply what they've learned in varied situations. Role-playing, for example, can help students learn how to analyze situations from several viewpoints (New London Group, 1996). Students restructure their knowledge by extracting meaning from one context and applying it to another.

B. Multimodal Competence

Multimodal competence, which includes two or more modalities of communication, is the knowledge and skills needed to understand the many ways that meaning is created and knowledge is conveyed (Jewitt & Kress, 2003; Leeuwen, 2018; O'Halloran & Lim Fei, 2011). It focuses on how students acquire the skills necessary to evaluate multimodal texts critically and effectively communicate using multimodal representations (Kress, 2003; Leeuwen, 2018). Multimodal literacy, according to Walsh (2010), is the process of representing meaning. Meaning-making by reading, observing, comprehending, responding to, creating, and interacting with digital and multimedia texts is referred to as multimodal competence, she stresses. In addition to writing, creating, and producing such texts, it may involve gestural and oral forms of speaking, listening, and dramatizing.

According to a different definition put forward by Bowen and Whithaus (2013), multimodal competence is the process of developing multimodal compositions and using knowledge to adapt them to particular social contexts. In defining multimodal literacy, Leeuwen (2018) highlights the importance of social context. According to him, multimodal competence is the capacity to employ and blend many semiotic modes in ways that suit the particular situation.

As a result, classroom instruction to improve students' multimodal competence should involve students in both the creation of multimodal texts and

the development of their understanding of how these texts might serve diverse communication purposes important to social situations. Readers' perceptions of multimodal text building and how other genres and media impact those experiences should also be explicitly taught in the classroom. The idea highlights that multimodal literacy involves knowing more than simply what modes or multimodal texts are; it also entails understanding what multimodal texts accomplish.

The primary aim of multimodal competence is the creation of multimodal texts. Students are directed in the creation of multimodal texts by investigating how multiple modes interact and integrate one another to create coherent multimodal texts (for example, posters, advertising, websites, and news stories) (Unsworth, 2006, 2008).

This present study will try to describe how students' multimodal competence is improved through the enactment of multiliteracies pedagogy in a technology-supported speaking class. The integration of learning management systems, social media, and other friendly user applications is expected to reveal an alternative pedagogy to foster students' multimodal competence.

CHAPTER 3: METHODOLOGY

A. Research Design

A qualitative case study research design was employed in this study, which is pertinent to the previously mentioned objectives and research questions. For this study, a qualitative case study research design was deemed suitable for the following reasons: To improve their multimodal competency, this study first concentrated on a small sample of students who took a technology-supported speaking class and learned English using a multiliteracies methodology (Cohen et al., 2007; Creswell, 2007; Creswell & Poth, 2018; Hancock & Bob Algozzine, 2006; Yin, 2003).

Second, the case study provided an engaging depiction of real individuals in real situations (Cohen et al., 2007; Creswell, 2007; Creswell & Poth, 2018; Gering, 2007; Yin, 2003). The study's depiction of the current status of multiliteracies education (Cope & Kalantzis, 2015a; New London Group, 1996) will give participants an in-depth look at their most recent experiences as their multimodal competence improved.

Third, case studies rely on numerous sources of evidence to triangulate the case so that it may be easily comprehended (Yin, 2003). The researcher gathered information from four different sources: interviews, classroom observations, a questionnaire, and student artifacts. The many data sources allowed the researcher to acquire insight and examine the evolution of multimodal competence.

B. Research Site and Participants of the Study

1. Research Site

The study was conducted at the State Islamic Institute Curup's English Language Education Department (IAIN Curup). With a strong background in Islamic studies, the Department prepares students to teach English. As a result, in addition to academic understanding of the English language and English language training, the institution's curriculum emphasizes knowledge of Islamic studies. Students are also given basic ICT skills by the institute. It is anticipated that students would graduate as proficient English teachers with a solid understanding of Islam and a keen understanding of technology. Therefore, the English department's selection is pertinent to the primary objective of this study.

2. Participants

This research involved 20 participants. They are fifth-semester students of a bachelor's degree. The participants are students who are taking the Speaking for Academic Setting course. The participants have also completed basic ICT classes; thus, they are considered to have basic digital literacy abilities. Therefore, the materials and activities for the study, according to the researcher, were acceptable for their English and computer literacy levels.

C. Data Collection Techniques

This study used four data gathering strategies to fulfill data triangulation: classroom observation, interviews, a questionnaire, and student artifacts. Each form of data collecting was crucial and advantageous in fostering a distinct perspective on the topic of interest, and also contributed significantly to a fuller image of the scene of interest. Furthermore, the researcher will be able to undertake an in-depth analysis due to the researcher's extensive repertoire of contextual perspectives on the case and the arrangement of the study for validation techniques and transferability.

1. Classroom Observation

Following the study's aims, one of the data collection methods was a series of observation activities in the classroom. The researcher watched the teaching and learning processes in the classroom for twelve sessions, acting as both a "teacher as researcher" and a participant observer. The observations focused on student activities and interactions that occurred during the instructional process.

To improve the reliability of observational evidence, eliminate bias, and avoid missing significant occurrences during the observation process, the researcher used two observational approaches: a research collaborator and video recording (Cohen & Manion, 1994; p. 112). In terms of study collaborators, the researcher requested the aid of one of his colleagues in observing and

recording all events during the teaching process. In terms of recording, the researcher used a recording device (i.e., a video recorder) to capture classroom activity.

2. Interview

The current study's research questions stressed the use of multiliteracies pedagogy in building students' multimodal competence. As a result, the researcher concludes that a semi-structured interview was the best way to interview the respondents. The researcher was able to stay focused on the study subject while gathering pertinent but not constrained information from the participants' responses to a series of interview questions thanks to this semi-structured interview (Yin, 2018). For this study, a set of criteria was developed ahead of time, and these criteria then served as direction for the researcher as she explored participants' replies during the interview process. Like a discussion, an interview can spark participants' drive to share what they believe, feel, and perceive profoundly and insightfully regarding a topic being addressed.

3. Questionnaire

This study's questionnaire data came from an online open-ended questionnaire. This questionnaire, which included eight questions, was designed to elicit students' reactions to the adoption of a multiliteracies program in a technology-

supported speaking class. The purpose of the questions was to evaluate the coherence of the students' answers and to validate the results of the interview data. Information on the English teaching and learning process they experienced over the course of a semester was revealed by the first investigation. The knowledge and abilities they acquired after finishing the multiliteracies program were the subject of the second and third questions. The purpose of the fourth and fifth questions was to find out how the students felt about the tasks and assignments that they were given throughout the lesson. The purpose of the sixth question was to find out what the kids thought about the use of technology in the classroom. The seventh and last question focused on the problems that the students encountered during the course and their recommendations on how to make it better.

4. Students' Artefacts

In this study, artifacts are things made by students throughout the teaching and learning process. Artifacts can be collected for this study to provide evidence of what occurred before (baseline data), during (process data), and after (effects data), which may indicate treatment results. In this study, numerous student artifacts were used as data sources, including diagnostic scores and three multimodal artifacts: digital posters, digital presentations, and digital movies.

D. Data Analysis

The research looked into how multiliteracies pedagogy helped EFL learners build multimodal competence. Several data gathering methods were used to fully understand the phenomena, including interviews, classroom observation, questionnaires, and student artifacts. All data were reviewed qualitatively both during and after the investigation.

The qualitative analysis technique developed by Creswell was employed for the analyses (Creswell, 2012). The steps of data analysis were as follows: First, the researcher gathered the data, which included observation notes, students' digital posters, students' digital presentations, video animations, questionnaires, and interviews. Second, the data were processed for analysis and then reviewed to acquire a sense of how the educational program is executed in building students' multimodal competence. Third, in the next section, the researcher coded the data to locate the text segments and assign them a code label. Finally, the data were iteratively coded into the description and subjects of the study report.

CHAPTER 4: FINDINGS AND DISCUSSIONS

This section summarizes the study's findings based on a range of data sources, including semi-structured interviews, written, open-ended questionnaires completed by students, classroom observations, and multimodal artifacts generated by students. While data from interviews and open-ended questionnaires were used to learn about the students' opinions on the implementation of the teaching program, data from classroom observations and multimodal tasks were used to track the students' progress in multimodal literacy learning. To address the study questions—namely, how multiliteracies pedagogy supports multimodal literacy development in the ESP course and the students' reactions to the multiliteracies program's implementation—the talks are roughly split into two pieces.

A. The Development of Students' Multimodal Competence in Multiliteracies Pedagogy-Based Speaking Class Supported by Technology

The evidences of students' learning were first conducted by looking at the students' success in accomplishing the projects assigned. To evaluate students' digital posters, the first rubric was created. To examine the multimodal components, the visuals, the aesthetics, the grammar, the mechanics, the learning autonomy, the inventiveness, and the presentation as a whole, eight categories were established. Each category

included five bands that represented varying degrees of proficiency: outstanding, good, fair, marginal, and insufficient. To evaluate the students' work on video production projects, the second rubric was created. The assessment tool was modified from Hafner and Ho (2020), who used it to evaluate students' digital multimodal compositions in the form of scientific documentaries. Five elements comprised the rubric: 1) content and structure; 2) visual effects and multimedia; 3) language; 4) learning autonomy; and 5) innovation. Five bands—outstanding, good, adequate, marginal, and failed—were also included in this rubric. The average score of the digital poster project was 31,3 out of 40 points, the average score of the first video production project was 20,7 out of 25 points, and the average score of the second video production project was 19,6 out of 25 points. This demonstrated that the students' multimodal expertise allowed them to produce a broad variety of multimodal writings. When it came to creating digital posters, the students performed the assignment rather effectively. In terms of demonstrative digital video production, the students could perform well in the project's accomplishment. Meanwhile, the students seemed to have a slight ability in producing persuasive digital video production. It can be inferred from the result scores above that the students' performance in the second project exceeded the performance of the first and the second project. To put it another way, the tasks of making digital posters and digital multimodal persuasive texts were far more challenging than the task of making digital multimodal

demonstrative texts.

Students' developing abilities to perceive and portray themselves through multimodal texts were also revealed by the examination of their projects. They were considered proof of multimodal literacy learning (Walmart, 2010; Lim, 2018; Jewitt & Kress, 2003). The research also supported Callow's (2013) assertion that color plays a significant role in visual texts and may affect a viewer's emotions by evoking a certain mood or evoking a response to a person, location, or item.

The data on video project and digital poster revealed students' development of using design elements which included linguistic aspects comprising of generic structure and linguistic features, and non-linguistic aspects comprising visual, audio, gestural, and spatial design (New London Group; 1996, 2000). The students' knowledge in identifying and applying linguistic and non-linguistic designs of multimodal texts directly showcases their ability in viewing (consuming) and representing (producing) themselves through multimodal texts (Lim, 2018).

This study has demonstrated how multiliteracies pedagogy supports students' multimodal literacy development in a speaking class by examining the orchestration of the multimodal elements in three given projects. According to the study's findings, the teaching approach achieves learning objectives centered on multimodal literacy while giving students worthwhile experiences. By actively participating in class activities and completing their assigned projects, the students demonstrated good learning outcomes. The results of

this study are consistent with those of some earlier research showing the benefits of using multiliteracies education to improve multimodal literacy and English language acquisition (Cocchetta, 2018; Dzekoe, 2017; Ganapathy, 2015; Hafner, 2014; Kaminski, 2019; Kumagai, Kanoeda, & Nishimata, 2016; Lee, Ardeshiri, & Cummins, 2016; Lim, 2018; Millaray, Cárcamo, Heraldo, & Larenas, 2016; Mulatsih, 2016; Ruan, 2015; Souzandehfar, Saadat, & Sahragard, 2014; Yi & Choi, 2015).

Furthermore, this study's incorporation of technology has given students real-world experience the chance to combine a wide range of semiotic modes into a single multimodal text through tasks including producing, re-producing, and sharing this multimodal text. Furthermore, this study's use of technology helps students learn more effectively, participate in meaningful activities, be more creative and engaged, and become more motivated in their speaking classes.

B. Students' Perceptions on the Implementation of Multiliteracies Pedagogy in A Supported-Technology Speaking Class

The opinions of the students on the use of multiliteracies pedagogy in the speaking class are included in this part. A questionnaire and interviews were used to gather the data. The triangulation approach was then used to cross-validate the data in order to capture various aspects of the students' replies and to obtain a thorough comprehension of them. Students' overall opinions of the teaching program,

including their views on the use of technology and multimodal texts, and their recommendations for more program enhancement were the two main themes that were established as guiding questions for the interview and the questionnaire. All of the students who participated in the teaching program were interviewed at the conclusion of the program. This interview was conducted in order to get detailed information on the students' opinions of the teaching program and to assist them in becoming more conscious of the knowledge and abilities they acquired while the program was in operation. Because this study used a semistructured interview format, the interview questions were predetermined to help the researcher conduct the interview. This session consisted of seven questions that focused on various facets of implementing multiliteracies pedagogy, such as the use of technology and multimodality in the speaking class. With the interviewees' consent, the interview was audio recorded. The researcher scheduled the interviews and made sure the session took place in a peaceful setting free from disruptions. In order to encourage and support the students in expressing their ideas, opinions, and impressions in a profound and perceptive manner, a relaxed and cordial dialogue was favored throughout the interview (Yin, 2014). Although Bahasa Indonesia was used for the interview, the interviewees were free to express themselves in English. The contestants' native tongue is Bahasa Indonesia.

The online questionnaire survey served as the

second source of information for gathering student opinions about the course. Google Docs was used to develop this online survey. Because it provides flexibility and convenience in several ways, an online questionnaire was used. Initially, the students were free to respond to the questions whenever it was most convenient for them. They may take as much time as necessary to respond to each inquiry. Second, the researcher may distribute the questionnaire quickly, cutting down on the amount of time needed to gather data and bring a survey into the field. Last but not least, both the students' completion of the online survey and the analysis of their answers were comparatively easy. The researcher immediately had all of the data saved in a database when the questionnaire was turned in.

The use of multiliteracies pedagogy in their speaking class was generally well received by the pupils. The table below summarizes the opinions and recommendations of the students on the multiliteracies teaching program.

Central Themes	Students' Perception
Students' general perceptions of the teaching program	1. The instructional program was seen by the pupils as very motivational and engaging. The assignments and exercises were skillfully designed to foster the development of autonomous, imaginative, creative, and self-assured learners. 2. The students said that the

	course had helped them learn a lot of new information outside of English, such as digital skills, which helped them in their field of study (informatics engineering), as well as in their future careers and public lives.
Students' perceptions of the integration of technology in the teaching program	1. According to the kids, technology in the classroom is very stimulating and adds excitement to the learning process. 2. The students thought that, at the age of the Industrial Revolution, using technology in the classroom was crucial. 4.0 3. The students believed that using technology in the classroom enhanced their digital and English language proficiency. 4. According to the students, using technology in the classroom, such as downloading course materials, turning in digital projects, looking for more sources to expand their knowledge, and producing digital products, facilitated their learning. 5. The students were told that

	since technology was relevant to their field of study, it was OK for them to utilize it in the classroom.
--	---

Most of the students believed that their autonomy and creativity had developed. Since learner autonomy has been recognized as one of the key determinants of language learning success, cultivating autonomous learners is fundamental to the theory and practice of language instruction in the context of teaching English. The findings were in line with other studies on the multiliteracies approach, in which this approach was able to enhance students' motivation and autonomy in English language teaching (Ajayi, 2015; Ganapathy, 2016; Freyn, 2017; Huang, 2017; Lirola, 2018; Varaporn & Sithitikul, 2019. Freyn, 2017),

The students' awareness of their improved English and digital skills, and also their self-motivated learning and creativity, led the researcher to conclude that the students, to some extent, had turned up to become multiliterate persons. As was already mentioned, a multiliterate person possesses a number of unique traits, two of which are having a repertoire of practices (knowledge, skills, and strategies) that can be tailored, modified, and applied suitably for various audiences, purposes, and contexts. They also understand how to use both new and traditional communication technologies and that multimodal texts are delivered using a combination of digital, live (face-to-face), and paper technologies (Anstey and Bull, 2018).

The perception data also indicated that the teaching program had successfully achieved most of its goals, indicated by the learners' acknowledgment of the improvement in their multimodal literacy and communication skills as well. According to Cooper et al. (2013) and the New London Group (1996), learners are supported by a pedagogy that provides them with ample opportunities to multimodally examine diverse information sources and content, critically explore the information, and become active meaning-makers and effective communicators.

This implies that, because multiliteracies pedagogy is defined as creative, productive, constructive, and, most importantly, transformative, educators must create learning environments that allow students to engage in a variety of creative and cognitively demanding literacy practices, as well as integrate text-based and multimedia forms of meaning making (Cope & Kalantzis, 2000; New London Group, 1996).

The study found that students' perceptions of the use of technology in the classroom were generally positive. The results revealed five aspects of the technological integration: The students in their Speaking class (1) believed that the use of technology in the classroom was highly engaging and motivating (Wilson and Whitlock 1998, Yunus et al. 2013); (2) believed that the use of technology in the classroom was essential in the era of Industrial Revolution 4.0 (Warschauer, 1997); (3) believed that the use of technology in the classroom helped them improve their

digital and English language skills; and (4) stated that the use of technology in the classroom facilitated their learning (i.e. downloading course materials, submitting the digital projects, seeking additional sources for widening their knowledge, creating digital products); (5) the students informed that the use of technology in the classroom was rightly fitted them as it was in line with their field of study.

CHAPTER 5: CONCLUSION

A. Conclusion

The study's main conclusions emphasize the benefits of using multiliteracies pedagogy to support students' multimodal literacy development, especially their ability to effectively view, construct, represent, and communicate using a variety of multimodal resources. Observing and understanding a visual text (such as a digital poster or a video clip) represented the practices of viewing, while utilizing and creating multimodal texts in a digital format demonstrated the practices of representation. The highly visible multimodal literacy skills that the students developed through the creation of the digital poster and digital video presentations include their ability to view and compose multimodal texts delivered via paper and digital technology devices in content-specific language related to the informatics engineering discipline, to construct multimodal texts that include words (language), still and moving images (the visual and gestural), and sound (audio), and to effectively communicate using multimodal resources.

The study's findings, in summary, show that teaching multiliteracies pedagogy in speaking classes enables students to be multimodally competent communicators who can comprehend the combined potential of several modes for meaning-making. In today's literacy environment, multimodal communication skill is deemed important, as noted by Cook (1991, 2002) and Nelson (2006, p. 72). They assert

that we need to develop multimodal, multimedia "multi-competence" (Cook 1991). In order to perform and promote strong personal expression, we, our students, and ourselves now more than ever require the greatest degree of comprehension of the 186 semiotic workings and affordances of language, as well as of other modalities (Nelson 2006: 72). In order to better engage in multiple literacies for academic, personal, and social purposes, it is critical to build multimodal communicative competence in addition to linguistic ability. In terms of how the students responded to the implemented teaching program, they usually had a good opinion of it and gave positive comments on the teaching and learning activities as a whole. Although demanding, the multiliteracies teaching program was seen as very inspiring, powerful, and engaging. Since many English language learners fail English lessons due to a lack of desire and engagement, it is thought to be essential to increase students' motivation and engagement. Because of their associations with academic performance, perseverance, and happiness, motivation and engagement have been dubbed "the holy grail of learning" and are thought to be important factors in determining students' learning success. In the meantime, the ability to communicate and be creative is crucial in the twenty-first century and is the secret to success in both their personal and professional lives. It was also thought that the curriculum helped children become self-sufficient, imaginative, creative, and self-assured learners. The students recognized the improved English and digital skills they acquired via active

participation in the teaching program, which helped them in their field of study as well as in their future careers and public lives.
